

The Private Bird Collection of Dr. Peter FREY at the Naturkundliches Heimatmuseum Düsseldorf-Benrath

Behrend HOHORST & Renate VAN DEN ELZEN

Rheinisches Archiv- und Museumsamt and
Alexander Koenig Research Institute and Museum of Zoology, Bonn

Abstract. Between 1888 and 1940, the physician and ornithologist Dr. Peter FREY compiled a rather extensive collection of palearctic birds, mainly from the vicinity of Leverkusen. It contains unique records of previous breeding species like Black Grouse, *Lyrurus tetrrix*, Capercaillie, *Tetrao urogallus*, Ferruginous Duck, *Aythya nyroca* and Aquatic Warbler, *Acrocephalus paludicola*. The collection is now stored at the municipality of Leverkusen.

Key words. Historical collections, historical breeding ranges; Naturkundliches Heimatmuseum Benrath

1. THE COLLECTOR

The physician and ornithologist Dr. Peter FREY was born 22.11.1872 in Linnich (Rhineland) and practiced as physician in the German town Leverkusen-Wiesloch where he died 18.07.1954. The passionate field ornithologist and hunter never married. During his life he compiled a rather extensive collection of palearctic birds, mainly from the vicinity of Leverkusen, that was stored in two rooms of his house and practice at Wuppertal-Wiesloch. He prepared and mounted nearly all specimens himself and presented them lifelike in glass display cases, the wooden backgrounds neatly painted by his own hand.

2. HISTORY OF THE COLLECTION

Peter FREY tried in vain to convince the city of Leverkusen to take over his collection after his death and present it in a museum. By his last will he therefore arranged its sale to the Naturkundliches Heimatmuseum Benrath, to secure it through the care and curation of the director of the museum, his old friend Dr. Heinrich OPLADEN.

When the Naturkundliches Heimatmuseum Benrath lost its independence and was merged with the Löbbecke-Museum Düsseldorf after OPLADEN's death only two years later, the FREY collection lost its curator at the same instant and was given up to decay. During fundamental renovations of the Benrath Museum it was moved and great parts were completely destroyed in ignorance of its scientific value. The remains suffered from bad storage conditions and some parts of the collection are still lost.

In 1976, when the first author started his curatorship at the Naturkundliches Heimatmuseum Benrath, he

received the collection in even worse condition, due to the fact that most of the labels were lost or mixed up.

A nearly complete reconstruction of the FREY collection became possible due to some lucky circumstances. In 1954 the city of Leverkusen had ordered a complete photographic documentation (made by AGFA) of the collection before selling it to the museum in Benrath. The remains of this photo series and a complete inventory list with comments on finding localities were handed over to the Benrath Museum. Additionally, the lost catalogue was recovered together with a great part of the displaced collection of smaller birds without legs, that unfortunately had been cut off during removal from the display cases before storing.

This completion of information allowed reconstruction of the collection and listing all lost specimens. Today the collection is stored at the municipality of Leverkusen.

3. SCIENTIFIC VALUE OF THE COLLECTION

The first information on collection data and field observations was given by Peter FREY himself, when he published and edited his „Avifauna of Leverkusen“, which was distributed only in limited numbers (FREY 1948). Some of the collection data are unique documents of previous breeding ranges of bird species that soon after their documentation either became extinct or endangered (Red List Species), due to habitat loss and deterioration. Other scientists recognised the value of these collection data early and thus they were included in the succeeding avifaunas of the Rheinland (NEUBAUR 1957, MILDENBERGER 1982, 1984) or the Handbook of Birds of Middle Europe (GLUTZ VON BLOTZHEIM 1966-1997).
